Full marks are not necessarily awarded for a correct answer with no working. Answers must be supported by working and/or explanations. In particular, solutions found from a graphic display calculator should be supported by suitable working. For example, if graphs are used to find a solution, you should sketch these as part of your answer. Where an answer is incorrect, some marks may be given for a correct method, provided this is shown by written working. You are therefore advised to show all working.

Section A

Answer all questions. Answers must be written within the answer boxes provided. Working may be continued below the lines, if necessary.

1. [Maximum mark: 7]

The 3rd term of an arithmetic sequence is 1407 and the 10th term is 1183.

- (a) Find the first term and the common difference of the sequence. [4]

- (b) Calculate the number of positive terms in the sequence. [3]

$$(a) \begin{cases} u_3 = u_1 + 2d = 1407 \\ u_{10} = u_1 + 9d = 1183 \end{cases} \text{ } \left. \begin{array}{l} \text{1st solve} \\ \{1471, -32\} \end{array} \right. \quad \cancel{\text{1st solve}} \quad \cancel{\{1471, -32\}}$$

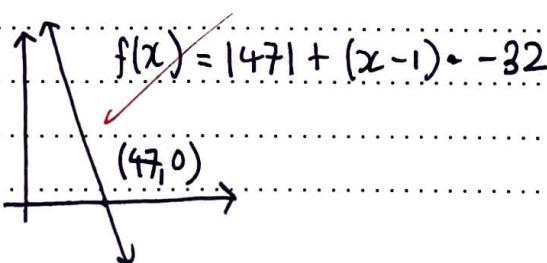

$$\therefore u_1 = 1471 \quad \cancel{4}$$

$$\therefore d = -32$$

$$(b) u_n = u_1 + (n-1)d > 0$$

$$1471 + (n-1)(-32) > 0$$

The equation $x^2 - 5x - 7 = 0$ has roots α and β . The equation $x^2 + px + q = 0$ has roots $\alpha + 1$ and $\beta + 1$. Find the value of p and the value of q .

$$x^2 - 5x - 7 = 0 \quad \alpha + \beta = 5 \quad \text{... (1)}$$

$$\alpha^2 + p\alpha + q \quad \alpha\beta + 2 = -p \quad \text{... (3)}$$

$$(\alpha + 1)(\beta + 1) = q \quad \text{... (4)}$$

$$\therefore \alpha\beta + \alpha + \beta + 1 = q \quad \text{... (5)}$$

$$\therefore (1) \text{ and } (3): \quad -p = 5 + 2$$

$$\boxed{p = -7}$$

$$(2) \text{ and } (1) \text{ and } (4): \quad \alpha\beta + (\alpha + \beta) + 1 = q$$

$$\therefore q = 5 + (-7) + 1$$

Let $f(x) = \tan(x + \pi) \cos\left(x - \frac{\pi}{2}\right)$ where $0 < x < \frac{\pi}{2}$

Express $f(x)$ in terms of $\sin x$ and $\cos x$.

$$f(x) = \tan(x + \pi) \cos\left(x - \frac{\pi}{2}\right) \quad 0 < x < \frac{\pi}{2}$$

$$= \frac{\sin(x + \pi)}{\cos(x + \pi)} \cos\left(x - \frac{\pi}{2}\right)$$

$$= \frac{\sin x \cos \pi + \cos x \sin \pi}{\cos x \cos \pi - \sin x \sin \pi} \left(\cos x \cos \frac{\pi}{2} + \sin x \sin \frac{\pi}{2} \right)$$

$$= \frac{-\sin x + 0}{-\cos x - 0} (0 + \sin x) \quad \checkmark$$

$$= \frac{\sin x}{\cos x} \sin x$$

$$\therefore f(x) = \frac{\sin^2 x}{\cos x}$$

The age, L , in years, of a wolf can be modelled by the normal distribution $L \sim N(8, 5)$.

- (a) Find the probability that a wolf selected at random is at least 5 years old. [2]

Eight wolves are **independently** selected at random and their ages recorded.

- (b) Find the probability that **more than six of these** wolves are at least 5 years old. [3]

$$(a) L \sim N(8, 5) \Rightarrow \mu = 8 \quad \sigma = \sqrt{5}$$

$$\therefore P(L > 5) = \text{norm(df}(5, 9, 999, 8, \sqrt{5})$$

$$\therefore P(L > 5) \approx 0.910 \quad \boxed{0.910144} \quad 2$$

$$(b) X \sim B(8, 0.910144)$$

$$\therefore P(X > 6) = \text{binom(df}(8, 0.910144, 7, 8)$$

$$= 0.842732$$

$$\therefore P(X > 6) \approx 0.843 \quad \boxed{0.842732} \quad 3$$

- (a) Given that $2x^3 - 3x + 1$ can be expressed in the form $Ax(x^2 + 1) + Bx + C$, find the values of the constants A , B and C . [2]

(b) Hence find $\int \frac{2x^3 - 3x + 1}{x^2 + 1} dx$. [5]

$$(a) \quad 2x^3 - 3x + 1 = 2x^3 + 2x - 5x + 1 \\ = 2x(x^2 + 1) - 5x + 1$$

$$\begin{array}{|c|} \hline A = 2 \\ B = -5 \\ C = 1 \\ \hline \end{array}$$

2

$$(b) \quad \int \frac{2x^3 - 3x + 1}{x^2 + 1} dx = \int \frac{2x(x^2 + 1) - 5x + 1}{x^2 + 1} dx \\ = \int \frac{2x(x^2 + 1)}{x^2 + 1} dx + \int \frac{-5x}{x^2 + 1} dx + \int \frac{1}{x^2 + 1} dx \\ = \int 2x dx - 5x \cdot \frac{1}{2} \int \frac{2x}{x^2 + 1} dx + \int \frac{1}{1+x^2} dx \\ = \frac{2}{3}x^3 - \frac{5}{2} \int \frac{1}{u} du + \arctan x + C \\ = \frac{2}{3}x^3 - \frac{5}{2} \ln|u| + \arctan x + C \\ = \boxed{\frac{2}{3}x^3 - \frac{5}{2} \ln(1+x^2) + \arctan x + C} \quad 4$$

The mean number of squirrels in a certain area is known to be 3.2 squirrels per hectare of woodland. Within this area, there is a 56 hectare woodland nature reserve. It is known that there are currently at least 168 squirrels in this reserve.

Assuming the population of squirrels follow a Poisson distribution, calculate the probability that there are more than 190 squirrels in the reserve.

It is known that the number of fish in a given lake will decrease by 7% each year unless some new fish are added. At the end of each year, 250 new fish are added to the lake. At the start of 2018, there are 2500 fish in the lake.

(a) Show that there will be approximately 2645 fish in the lake at the start of 2020. [3]

(b) Find the approximate number of fish in the lake at the start of 2042. [5]

(a)	2018	Year	Fish	$(1-0.07)$	+ 250

Each of the 25 students in a class are asked how many pets they own. Two students own three pets and no students own more than three pets. The mean and standard deviation of the number of pets owned by students in the class are $\frac{18}{25}$ and $\frac{24}{25}$ respectively.

Find the number of students in the class who do not own a pet.

$$\cancel{\mu = \frac{18}{25}} \quad \cancel{\sigma = \frac{24}{25}}$$

$$X \mid \cancel{0} \mid 1 \mid 2 \mid 3 \mid \cancel{\frac{2}{25}}$$

$$x=p \quad q \quad r$$

$$\Rightarrow q + 2r + \cancel{6/25} = E(x) = \frac{18}{25}$$

$$\Rightarrow \frac{24}{25} = \sqrt{(p - \frac{18}{25})^2 + (q - \frac{18}{25})^2 + (r - \frac{18}{25})^2 + (-\frac{16}{25})^2}$$

 \Rightarrow

$$\mu = \frac{18}{25} = E(x)$$

$$\sigma = \frac{24}{25}$$

$$\therefore \Rightarrow q + 2r + \cancel{\frac{16}{25}} = 25 \quad \dots (1)$$

$$\therefore q + 2r = 19$$

$$\Rightarrow \frac{24}{25} = \sqrt{(p - \frac{18}{25})^2 + (q - \frac{18}{25})^2 + (r - \frac{18}{25})^2 + (\cancel{\frac{16}{25}})^2} \quad \dots (2)$$

$$\Rightarrow \frac{p+q+r+2}{25} = \frac{18}{25} \quad \dots (3)$$

$$\therefore p+q+r = \frac{72}{25} - 2$$

$$p = \frac{72}{25} - 2 - (q+r)$$

$$4 + t = 0.32 + 1.8t$$

(a) let \vec{r}_A have $t = \lambda$
let \vec{r}_B have $t = \mu$

~~equating y:~~ $4 + \lambda = 3.2 + 1.2\mu \dots (2)$

(1) and (2) : $\lambda = 4 \quad \mu = 4$

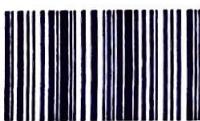

testing with z: $-1 - 0.15 \times 4 = -8/5$
 $-2 + 0.1 \times 4 = -8/5$
