Mathematics: analysis and approaches Higher level Paper 3 Practice Set B (Hodder)

1 hour

Instructions to candidates

- Write your session number in the boxes above.
- Do not open this examination paper until instructed to do so.
- A graphic display calculator is required for this paper.
- Answer all questions.
- Unless otherwise stated in the question, all numerical answers should be given exactly or correct to three significant figures.
- A copy of the mathematics: analysis and approaches formula book is required for this paper.
- The maximum mark for this examination paper is [55 marks].

Full marks are not necessarily awarded for a correct answer with no working. Answers must be supported by working and/or explanations. Solutions found from a graphic display calculator should be supported by suitable working. For example, if graphs are used to find a solution, you should sketch these as part of your answer. Where an answer is incorrect, some marks may be given for a correct method, provided this is shown by written working. You are therefore advised to show all working.

1 [Maximum mark: 30]

This question is about using sums of sequences to investigate the formula for integrating a polynomial.

a Prove by induction that

$$\sum_{n=1}^{n} r = \frac{n(n+1)}{2}.$$
 [7]

b Simplify $(n+1)^3 - n^3$. [27]

c By considering two different ways of expressing

$$\sum_{r=1}^{n} (r+1)^3 - r^3$$

show that

$$\sum_{n=1}^{\infty} r^2 = \frac{n(n+1)(2n+1)}{6}.$$
 [7]

d By considering splitting the region into *n* rectangles each of width $\frac{x}{n}$ and whose top right corner lies on the curve $y = x^2$, show that

$$\int_0^x t^2 dt \le \frac{x}{n} \sum_{r=1}^n \left(\frac{rx}{n} \right)^2.$$
 [4]

- **e** By considering rectangles whose top left corner lies on the curve $y = x^2$, form a similar inequality to provide a lower bound on $\int_0^x t^2 dt$.
- **f** By considering the limit as $n \to \infty$ prove that

$$\int_0^x t^2 \, \mathrm{d}t = \frac{x^3}{3}.$$
 [6]

[4]

2 [Maximum mark: 25]

This question is about estimating parameters from data.

Let X_1 and X_2 both be random variables representing independent observations from a population with mean u and variance σ^2 .

You may use without proof in this question the fact that

$$E(aX_1 + bX_2) = a E(X_1) + b E(X_2)$$

and

$$Var(aX_1 + bX_2) = a Var(X_1) + b Var(X_2).$$

- **a** Find an expression for \overline{X} , the random variable representing the sample mean of the two observed values.
- [1]

b Show that $E(\overline{X}) = \mu$ and find an expression for $Var(\overline{X})$ in terms of σ .

[4]

The sample variance is defined as

$$S^2 = \frac{X_1^2 + X_2^2}{2} - \overline{X}^2$$

- **c** i Find $E(X^2)$ in terms of Var(X) and E(X).
 - ii Show that $E(S^2) = \frac{1}{2} \sigma^2$.

[4]

An unbiased estimator of a population parameter is one whose expected value equals the population parameter.

- **d** i Show that $M = \frac{2X_1 + 3X_2}{5}$ is an unbiased estimator of μ .
 - ii When comparing two unbiased estimators, the one with a lower variance is said to be more efficient. Determine whether M or \overline{X} is a more efficient unbiased estimator of u.

[5]

In a promotion, tokens are placed at random in boxes of cereal. *Y* is the random variable describing the number of boxes of cereal that need to be opened, up to and including the one where a token is found. Two independent investigations were conducted.

- **e** The tokens are placed in cereal boxes with probability *p*. The presence of a token in a cereal box is independent of other boxes.
 - i Find an expression for L, the probability of observing $Y_1 = a$ and $Y_2 = b$ in terms of a, b and p.
 - ii Find the value of p which maximizes L. This is called the maximum likelihood estimator of p.

[8]

In the first observation, Y was found to be 4. In the second observation Y was found to be 8.

- **f** i Find an unbiased estimate for the variance of Y.
 - ii Find a maximum likelihood estimate for p.

[3]
